

ACCOUNT LEVEL SECURITY

Account Level Security provides your organization with enhanced security and streamlined account views. Using information based on a user's position within the organizational structure, users can enter, edit and view information using a reduced account set, based upon the access granted for accounts. This filtered set of accounts streamlines inquiry windows and eliminates errors caused when entries are made to inappropriate accounts. In addition, productivity is enhanced as account lookup lists are filtered to show only those accounts of interest to the particular user.

Organizational restructuring changes can easily be made and users remapped to their new role within the organization, without the need to restructure the chart of accounts. As an individual is mapped to a new role in the organization, his access rights to accounts correspond to his new position on the organizational tree.

Using Account Level Security, you can make your chart of accounts more manageable for users-eliminating errors while protecting your sensitive financial information.

Assign accounts to users within the organizational structure for streamlined account views.
